

VOC-FREE INK TREND EMERGES IN THE GLOBAL CARD INDUSTRY

Manufacturers, designers and banks are trying to reduce the use of volatile organic compounds (VOCs) in the global plastic card industry.

Certain regions of the world already provide a strict legacy environment when it comes to the use of chemical products and VOCs. Industries in the United States and the European Union can prevent the use of VOCs by creating legal frameworks. By working on Directive 1999/13/EC on the limitation of emissions of VOCs due to the use of organic solvents in certain activities and installations, the European Union fosters the eviction of VOCs. There is currently a gap between different parts of the world in terms of using solvent products or not, with or without VOCs. As a result

of new laws and taxes in some parts of the world, as well as new health, social and environmental ambitions, industries using inks with VOCs will have to modify their processes in the next few years.

Problems with VOCs

Short-term exposure to high levels of some VOCs can cause headaches, dizziness, lightheadedness, drowsiness, nausea and eye and respiratory irritation. These effects usually go away when the exposure stops. Long-term exposure to high levels of some VOCs in laboratory animals has caused cancer and affected the liver, kidney and nervous system. [1]

high-solid, solvent-less and waterborne technologies at an high-solids. These VOC control policies are pushing companies in the chemical, packaging, printing and coatings industries to adopt and industrialize new technologies, including inks to adopt and industrialize new technologies, including

VOCs. These policies mainly affect the operations of provinces in China are adopting laws and taxes against VOCs. These policies mainly affect the operations of provinces in China are adopting laws and taxes against VOCs. The State Administration of Taxation of China. [3]

and the State Administration of Taxation of China. [3]

according to a joint notice issued by the Ministry of Finance and the State Administration of Taxation, they are manufactured or imported with high levels of VOCs have an additional 4 percent consumption tax whether they are manufactured or imported with high levels of VOCs have an additional 4 percent

China's Move Toward VOC-Free Industries

VOCs have also been determined to be a major factor contributing to the formation of ground-level ozone, which has been shown to be a public health concern. [2]

Christian De Rueda – Technical Applications Manager, VFPI Ink Technologies

About the Author: Christian De Rueda joined VFPIk Tech-nologies as a technical applications manager. His main role is to help customers across the world using VFPIk products meet specific technical requirements with various equipment and processes. Before beginning his career in screen printing, he was a graphic designer. Working in screen printing for 38 years, he has held various positions including operator, supervisor, production manager, business owner and trainer. A leading player in the European market with a worldwide distribution, VFPIk Technologies covers an extensive range of applications and materials for printed labels, laminated PVC cards, printed electronics and packaging.

These breakthroughs will help raise consciousness, and a common understanding may lead to a full VOC-free industry within a few years. Within a few years, such as LED-curing, to keep developing new technologies, such as LED-curing, to continue to grow in other parts of the world while researchers also widely used in North America and their use will continue personally used in the cards. VOC-free UV-curable inks are personalizers of the cards. From the plastic card suppliers to will apply across the board, from the pigment card industry, this of eco-friendly products. In the plastic card industry, this printing, will invest more funds into the development and the general raising of awareness of environmental matters, companies in different industries, including

What to Expect in the Future

With the various new laws and regulations across borders and the general raising of awareness of environmental issues, companies in different industries, including printing on PVC accept overprinting of offset inks, lamination and embossing it produces a thin ink deposit, very good ink stability in the screen and has a finish closer to solvent-based inks.

Pearl and metallic colors came next. Then, researchers developed an advanced hybrid curing screen ink for plastic card printing. This water-based and UV curing ink for

the first orders of VOC-free ultraviolet (UV) inks in 2009. Numerous colors and adhere well to plastic media.

The first UV-curable inks were specially dedicated for bank cards, gift cards and loyalty cards and accepted overprinting, lamination process (peel test ISO 10373) and embossing operation. They are usable on all types of PVC, available in operation. They are usable on all types of PVC, available in
